Dear Sir:

This amendment is submitted in response to office action mailed on April 23, 2002.

Please amend the claims to read as follows:

1(Twice Amended). A method of managing from a client station a target object at a remote station via a telecommunications network, said method comprising the steps of:

- (a) generating a client object forming a representation of said target object, which client object is configured to identify methods of said target object which are remotely accessible and support manipulation of properties of said target object, said client object being further configured to implement said remotely accessible methods;
- (b) registering said target object and a network adaptor for a network protocol with a framework at said remote station;
- (c) associating said client object with a network adaptor for said network protocol at said client machine; and
- (d) enabling a client application to access said methods which support remote manipulation by instantiating said client object.
